

Trade Reporting Service Platform Development BUSINESS NEED

- This product is used to capture trades in Prime Brokerage system and trade files are stored on different systems.
- There was a need to get trade files from remote systems when not found locally.
- User gets errors when file is not available on local system.
- Each file is being processed by each system individually while other remote systems are sitting idle.
- System gives error when file is not on local system.

enableIT SOLUTION

- enableIT used AGILE methodology to cater to rapidly changing client requirements and need to take this solution to market in short time frame.
- Implementation included development of an API that was integrated with existing applications to support on demand file synchronization from remote systems.
- enableIT solution reduce the processing burden on single machine by providing remote file access and enhance the parallel processing behavior of application.
- enableIT solution made single trade file processing possible among various distributed systems.
- enableIT solution integrated with various existing applications to cater remote file access requirements.

Benefits

- Various Remote systems share trade processing burden by accessing files remotely.
- Single application fulfills remote file access requirements of various existing applications.
- User access trade files via Trade Admin which internally access files from remote if not found locally.
- Export file functionality now export files from remote system if not found locally
